# Big Data Essentials Course Preparation Guide

# Computer

- You will need to bring a laptop that has an SSH client, and (optionally) a development environment setup for the class

#### SSH Installation

- An SSH client software should be installed to connect to the training VM from your laptop
  - On Linux or Mac OS X machines, SSH client is built-in. To check, type (on a terminal)

\$ ssh

- If this shows some usage help and exits, SSH is installed
- otherwise, use your package manager to download SSH
- On Windows machines, popular SSH clients such as Putty and WinSCP, available at <a href="http://www.putty.org/">http://www.putty.org/</a> and <a href="http://www.putty.org/">http://www.putty.org/</a> and <a href="http://winscp.net">http://www.putty.org/</a> and <a href="http://winscp.net">http://winscp.net</a> respectively, can be installed and used

## Setting up a Development Environment

## For performing

- Apache Hadoop HDFS
- · Apache Pig
- · Apache Hive
- · Apache Sqoop
- Apache Flume

exercises, you will **not** require any special software. These exercises would be performed on the training machines you will log in (via SSH). You will be able to write Pig and Hive scripts/queries on the Hue web interface, too.

### Optional Development Environment

The default implementations we will provide to you are hosted in **github**, meaning that you need to have **git** installed on your computer. Git can be downloaded from <a href="http://gitscm.org">http://gitscm.org</a>

The example programs are **Apache Maven** projects, so a developer will typically need Apache Maven as well.

Apache Maven can be downloaded from <a href="http://maven.apache.org/download.cgi">http://maven.apache.org/download.cgi</a>, and the installation instructions are available here:

http://maven.apache.org/download.cgi#Installation
